

THEMES

- Very simple — like writing ggplot2 code
- Use an existing theme and modify it with `theme()`, using `%replace%`

```
theme_red ← function(...) {  
  theme_gray(...) %replace% theme(  
    panel.background = element_rect(  
      fill = "red"  
    )  
  )  
}
```
