

# The other verbs

- Everything from dplyr except:
  - `do()`
  - `summarise()`
- `bind_[nodes|edges|graphs]()` and `graph_join()`
- `morph()/unmorph()`, `crystallise()`, and `convert()`
- `reroute()`

# Tidygraph Algorithms

- Smooth integration of graph algorithms with verbs
- Graph computing context given implicitly (like `n()`)
- Consistent naming scheme for a tab-completion based workflow
